CSE-019: Introduction to Computing
Midterm **Make-Up** Exam

Fall 2026

Instructions

- Write your name and student ID clearly **on your Scantron**.
- This exam contains 15 multiple-choice questions. Select **one best answer** (a, b, c, or d) for each question, and clearly fill your selection **on your Scantron**.
- Complete the exam independently. Do not share answers with others during the exam.
- You may use one double-sided A4 paper for note.
- Do not use phones, laptops, tablets, e-readers, headsets, earphones, smart glasses, brain-computer interfaces, robotic assistants, drones, or other device to assist you in the exam.
- You will not need a calculator.
- At the end of the exam, submit your Scantron.
- The duration of this exam is 60 minutes.

1) What is output?

```
new_list = [["abc", "def"], 10, 20]
print(new_list[0])
```

a. abc

b. abcdef

c. ['abc', 'def']

d. ['abcdef']

2) What is output?

```
new_list = [["hello", "word"], "good morning", "have a nice
day"]
print(new_list[0:2])
```

a. ['hello', 'word']

b. [['hello', 'word'], 'good morning']

c. ['hello', 'word', 'good morning']

d. [['hello', 'word'], 'good morning', 'have a nice day']

3) What is output?

```
new_list =[10, 20, 30, 40]
for i in range(len(new_list)):
    if new_list[i] != new_list[-1]:
        new_list[i] *= 2
print(new_list)
```

a. [10, 20, 30, 40]

b. [20, 40, 60, 40]

c. [10, 20, 30, 40, 10, 20, 30, 40]

d. [20, 40, 60, 40, 20, 40, 60, 40]

4) What is output?

```
my_dict = {"AA":3, "BB": 2, "CC":1, "DD":0}
v1 = list(my_dict.keys())[list(my_dict.values()).index(1)]
v2 = {v:k for k, v in my_dict.items()}[0]
print(v1,v2)
```

a. CC DD

b. DD CC

c. AA BB

d. BB AA

5) What is output?

```
new_string = "Python"
my_index = 0
while my_index != len(new_string)/2:
    print(new_string[my_index:int(len(new_string)/2)])
    my_index += 1
```

a. Pyt
Pyt
Pyt

b. hon
hon
hon

c. Pyt
yt
t

d. hon
thon
ython

6) After the program runs, what is the value of y?

```
def print_sum(num1, num2)
    print(num1 + num2)

y = print_sum(4, 5)
```

a. 4 5

b. 9

c. 45

d. None

7) Which variable can be used in place of XXX in the following code?

```
def fahrenheit_to_celsius(f):
    fraction = 5 / 9
    c = (f - 32) * fraction
    return c

degrees = float(input("Enter degrees in Fahrenheit: "))
print(fahrenheit_to_celsius(XXX))
```

a. degrees

b. f

c. c

d. fraction

8) What is x's final value?

```
x = 10
y = 20
if y <= 2 * x:
    x = x + 5
else:
    x = x * 2
```

a. 10

b. 15

c. 20

d. 25

9) What conditions have to be true to make the following code display "B"?

```
if color == "red":
    if style < 3:
        print("A")
    elif style < 5:
        print("B")
    else:
        print("C")
elif color == "blue":
    print("D")
```

a. color is "red" and style is 4

b. color is "red" and style is 5

c. color is "red" and style is 6

d. color is "blue" and style is 3

10) What is the final value of z?

```
grades = { "A": 90, "B": 80, "C": 70, "D": 60 }
my_grade = 70
if my_grade not in grades:
    z = 1
else:
    z = 2
if "F" in grades:
    z = z + 10
else:
    z = z + 20
```

a. 11

b. 12

c. 21

d. 22

11) Excess indentation must be removed from which lines to make the code correct?

```
1. print("start")
2.     if x > 10:
```

```
3.          print("large")
4.          else:
5.      print("small")
6. print("done")
```

a. 1, 6

b. 1, 2, 3

c. 2, 3, 4

d. 2, 4, 5

12) What is the value of x after the following code is executed?

```
x = 7
If x < 7
   x = x + 1
x = x + 2
```

a. 7

b. 8

c. 9

d. 10

13) What values are in result_set after the following code is run?

```
my_set = {1, 2, 3, 4, 5, 6}
other_set = {2, 4, 6}
result_set = other_set.difference(my_set)
```

a. { }

b. {1, 3, 5}

c. {2, 4, 6}

d. {1, 2, 3, 4, 5, 6}

14) What is the value of y after the following code is executed? Note that the question asks for y, not x.

```
x = 10
y = x + 2
x = 12
```

a. 8

b. 10

c. 12

d. 14

15) What is a common word for the textual representation of a program?

a. code

b. prompt

c. interpreter

d. expression
